Local Administrator gets black screen upon log in of a staff computer

If you're getting a black screen when you log into the staff computer as an administrator, following are the steps to add the local administrator as a user on the computer, which will correct this problem. Note this procedure requires that the person doing it has departmental administrator privileges.

- Go to a command prompt and type "netplwiz" to get to the User Accounts

![User Accounts Window]

- Go to the Advanced Tab

![Advanced Settings Window]

- Click Advanced under Advanced user management
Under Groups click on Users

Click Add
Click Locations and change it to the local PC
Type administrator and click check names
When you see "[computer name]" administrator click OK

Click OK again to exit out of netplwiz and re-start the computer, then check that you're able to log in as administrator and get to the desktop.
